

MULTIDIRECTIONAL CONCEPT

Principle: independent suspended panels from 2 double-roller trolleys sliding in a top track (no floor track), avoiding any swaying that may damage the track, suspended ceiling or the floor.

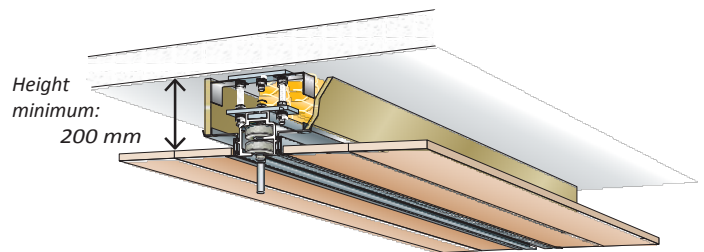

STORAGE EXAMPLE:

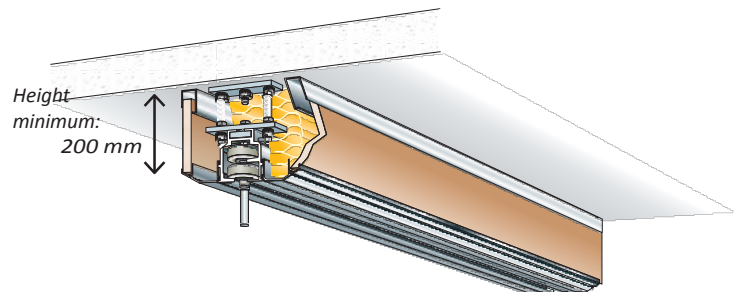

Aluminum semi-tubular track with double roller lips.

Track intersections enable any configuration, direction changes and multiple storage options without the use of turntables or switches.

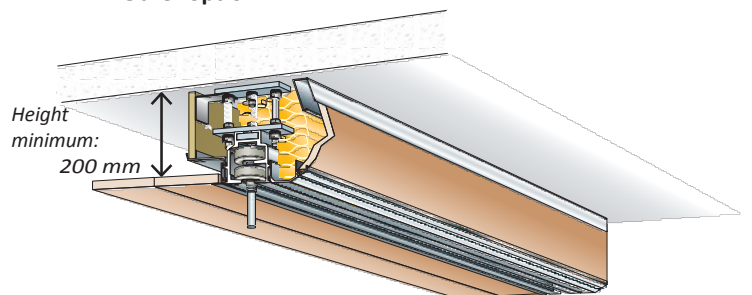

Track built into a suspended ceiling (with soundproofing)

Encased track

Other option

These installation methods are provided as examples only and are not contractually binding. Installation methods must be specifically calculated case on each partition. Furthermore, they must be validated and checked by the control office approved by the competent authorities.
